Turning NBC's Traffic Into Qualified Pipeline

You are training 15 AEs on how to convert. But today, a significant portion of NBC's potential high-value prospects are either not being captured by your upstream marketing—or landing on the site and failing to convert into pipeline because of front-door friction.

We ran an initial architectural analysis to understand where the gaps are.

What we found

1) Missed Discoverability (Traffic you should be getting but aren't)

Your ideal ICP (VP of Sales, Sales Directors) are actively searching for training parameters and specific sales solutions. If they aren't finding TalSmart/NBC properties first, that intent is bleeding to your competitors.

- **The Gap:** There is clear, existing upstream demand that isn't being fully captured before they verify intent.

2) Missed Conversion (Traffic you already have but don't convert)

Today, your website behaves like an expensive static brochure.

- It is the same journey for all visitors.
- There is no adaptation based on source or intent.
- **The 48-Hour Tax:** High-intent users browse, fill out a form, and wait hours or days for an SDR to follow up.
- There is no real-time qualification.
- **The Gap:** Even when the right buyers land, they often bounce before turning into SQLs.

The Opportunity

There are two massive leaks happening at the same time:

1. You aren't capturing all the verified upstream traffic you could.
2. You aren't converting the traffic you *do* capture while their intent is highest.

Most companies address these separately (Marketing handles traffic; Sales training handles conversion). **That's where revenue gets lost.**

What We Build (The Solution)

We are deploying a **Revenue Activation Layer** that connects Traffic → Intent → Conversion → Pipeline in a single closed-loop system. We replace your static forms with an autonomous engine.

Step 1 — Capture More High-Intent Traffic (Basin::Nexus)

- **The Signal Refinery:** We programmatically identify specific ICP targets and deploy specific messaging based on real-time triggers (funding rounds, executive hiring signals, etc.).
- **Result:** More of the exact target profiles are driven to your domain.

Step 2 — Activate All Traffic (Genie AI / Regata)

Across your key landing pages, we deploy an autonomous capture architecture:

- We adapt the messaging dynamically based on the visitor's intent and OSINT profile.
- We engage the users *immediately*—they do not need to scroll to look for a "Contact Us" button.
- **Result:** You dramatically reduce the time from Visitor to SQL automatically. You eliminate the endless sequence of nurturing steps.

Step 3 — Qualify and Route in Real-Time

- When the prospect engages the interface, **Voice AI** runs them through your exact MEDDIC/BANT frameworks in under 2 minutes.
- Once qualified, the system routes the sales-ready opportunity instantly via Slack.
- It bridges the NBC AE onto a **live video call with the prospect while they are still looking at your website (under 60 seconds)**.
- **Result:** Your 15 AEs engage the VP-level buyers explicitly when their intent is at its absolute peak. No more chasing cold inboxes.

The Outcome

Instead of treating traffic acquisition and sales conversion as two separate problems, you get a single deterministic system that turns existing and net-new traffic directly into qualified AE pipeline.

- **More pipeline from current traffic.**
- **Immediate ROI on upstream targeting.**
- **Zero additional SDR headcount required.**
- **Continuous, 24/7 capture of high-intent demand.**

This infrastructure sits directly between your traffic and your 15 newly trained AEs—and guarantees you never lose a high-intent buyer to the 48-hour response tax again.
